$ Chip n Split

Know who owes whom, every game and every trip.

Poker nights and shared expenses in one ledger. Log buy-ins and cash-outs, split the pizza, and get the fewest payments that square everyone up.

Installs on your phone | Sign in with Google | Free to run | Demo mode, no sign-up

1. Poker nights, start to finish
Buy-ins, rebuys, give-backs, cash-outs, settle-up

2. Expenses, Splitwise-style

Dashboard: where you stand overall

Groups at a glance

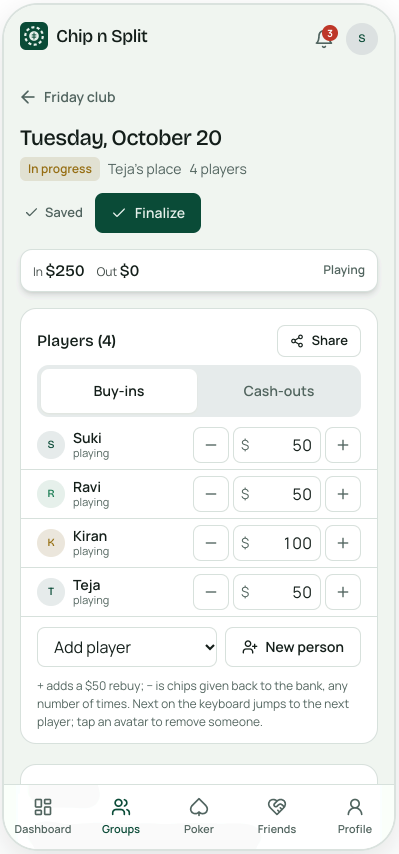

A poker night in progress

FEATURE 1

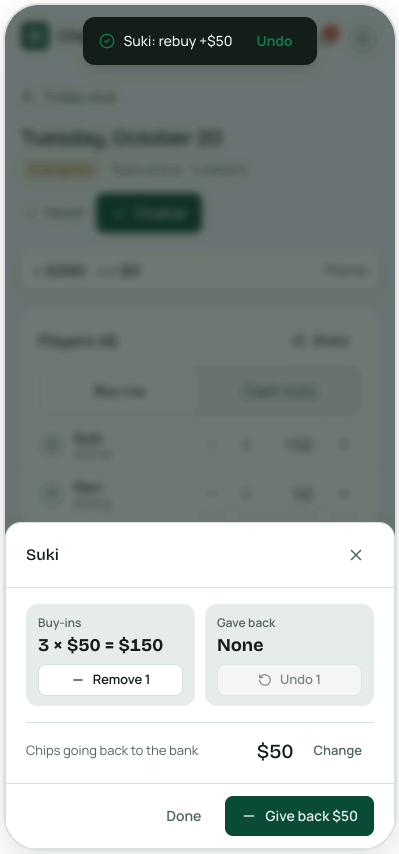

Poker nights, start to finish

Built for entering a whole table on a phone, while the game is happening.

- Start a game with the group's regulars; the buy-in per player is required, so nobody plays on a stale amount.
- **+** adds a rebuy in one tap; **–** opens the player's panel: buy-ins (*3 × $50 = $150*), chips given back, and one-tap fixes.
- Every tap shows an **Undo**, so a mistaken + is fixed without padding anyone's numbers.
- Cash-outs when the table breaks; a live table check makes sure money in equals money out.
- Finalize to get the fewest payments; tick each one off as **Paid**. Only the game's host can change it; everyone else follows live.
- Any member can start a game. Deleted a game by mistake? The host can **Restore** it, payments and all, from the group's History tab.
- **One table at a time:** while a game is in progress, New game points you to it instead of starting a second one. Rummy works the same way.

Buy-ins with – / + per player

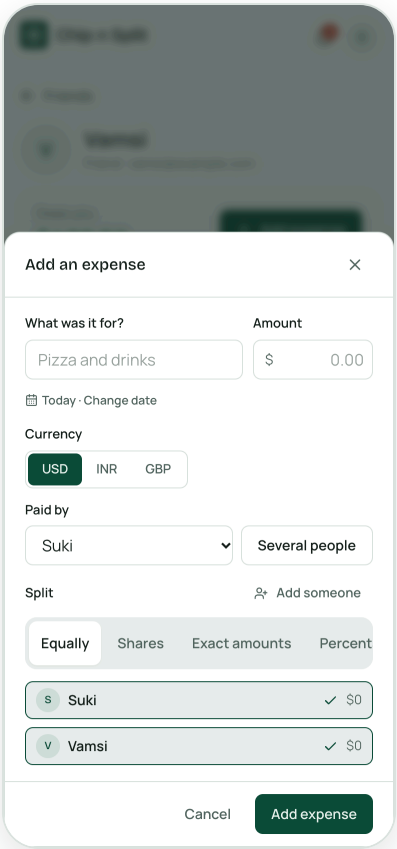

Player panel: counts, Remove 1, Undo 1

FEATURE 2

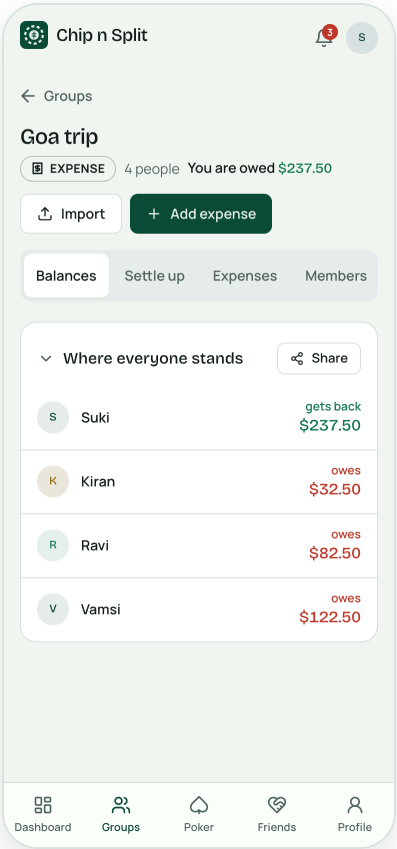

Expenses, Splitwise-style

Trips, rent and dinners, in a group or just between two friends.

- Short by default: what, how much, who paid, split equally or one person owes all.
- **More options**: several payers, split by shares, exact amounts, or percentages, always to the exact cent.
- **One-on-one** expenses with a friend need no group, and can be in **USD, INR, or GBP**; each currency keeps its own balance, never converted.
- Anyone in the group can add, edit, or delete an expense, and bring a deleted one back from History.
- Import a spreadsheet (Excel or CSV).

More options: currency, payers, split modes

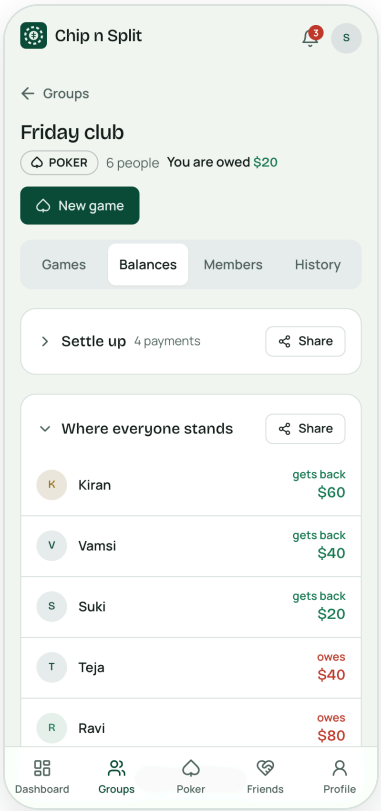

An expenses group

FEATURE 3

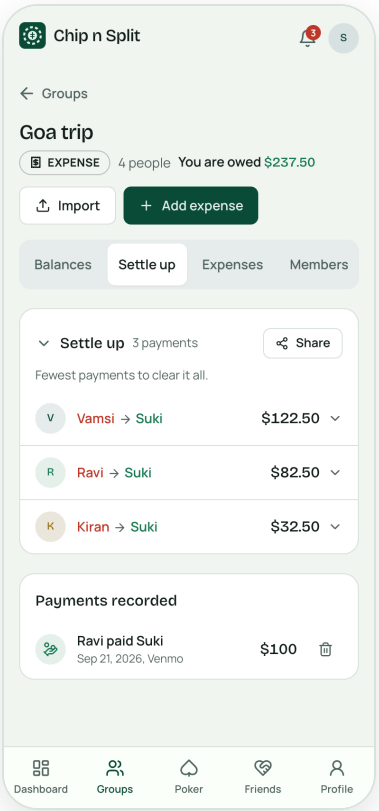

Balances you can trust

One number per person, adding up games, expenses, and payments, with the rules enforced by the database.

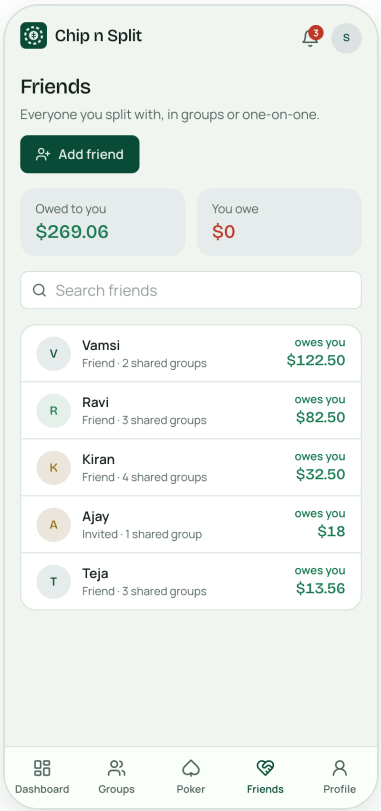

- Dashboard: **overall, you're up / you owe**, with **You get** and **You pay** at a glance, plus a banner for each poker or rummy game in progress you're playing in.
- Each friend's balance across every group and one-on-one, **biggest amount first** whether you're owed or you owe (green owes you, red you owe), settled-up friends last. The Dashboard lists groups the same way.
- A Poker or Rummy group's **Balances** tab: **Where everyone stands** open, **Settle up** collapsed until you tap it. An **Expense** group gives them two tabs, **Balances** and **Settle up** (with Payments recorded), both open. The fewest payments to clear it all, record a payment in one tap, remind someone by email.
- Settled-up people are tucked away; groups and games can't be deleted while money is still owed.

Poker: Settle up and where everyone stands

Expense group: its own Settle up tab

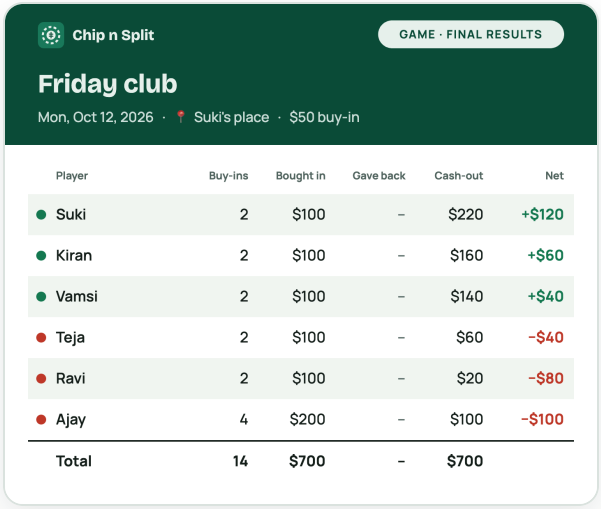

Friends, across all groups

FEATURE 4

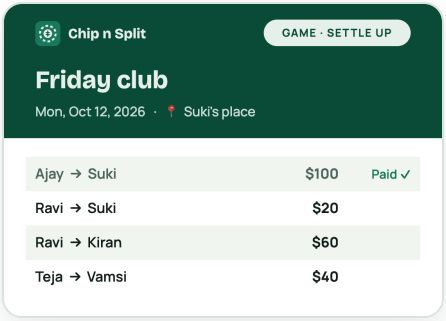

Share images & summaries

Clean, color-coded pictures to drop into a group chat, made right in the app. Green is up, red is down.

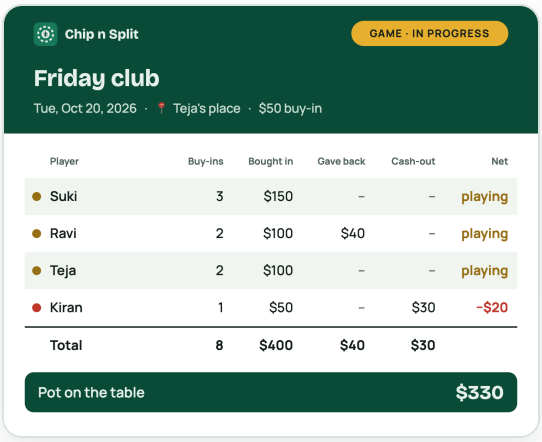

- Every picture opens with a **banner**: the Chip n Split logo, a clear label (**Game · In progress** in gold, **Game · Final results**, **Game · Settle up**, **Group · Balances**, **Group · Settle up**), the group, and when: the game's date, place, and buy-in, or *as of* today.
- Every card has its own **Share** and sends one picture of just that card: a game's **Players** and **Settle up** (with **Paid ✓** marks), a group's **Where everyone stands** and **Settle up**. A game in progress shows the pot on the table.
- The top of a game or group page has one plain **Email summary** button; one-person **reminders** open pre-filled in your own mail app too.
- Only the picture is sent, no extra text; longer lists get tighter rows.

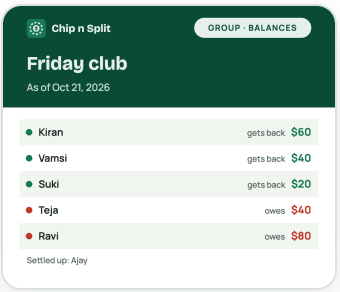

Players card → Final results

Settle up card → its own picture

FEATURE 5

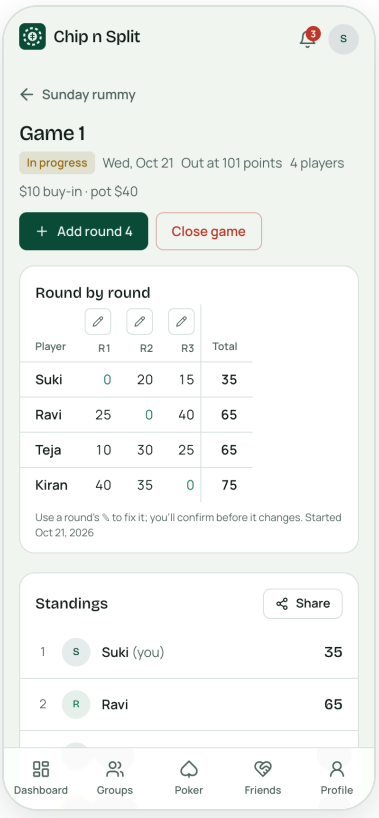

Poker, Rummy & Expense groups

Every group has one job, picked when you make it.

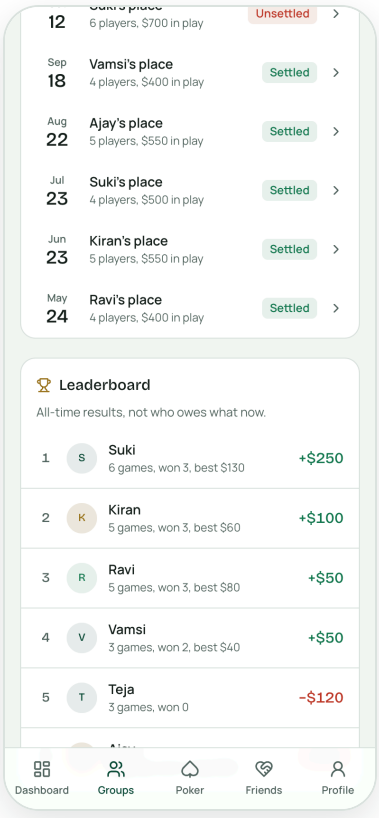

- **New group** in two short steps that fit above the phone keyboard: tap **Poker**, **Rummy**, or **Expense**, add a name and currency, then pick friends and create.
- One clear button at the top of each group: **New game**, **New rummy game**, or **+ Add expense**.
- **Rummy** groups score pool rummy hand by hand (up to 7 players, out at 101, 151, or 201; a buy-in is required, like poker; rejoin at the top score + 1, which the scorer can change), with everything Poker has: only the person who started it can change it, **In progress** / **Final**, Share, History, and a payout that goes into balances by itself with **Mark paid** per payment. Like poker, a game can't be deleted until it's settled, and the payout follows the result: deleting the game, or an edit that puts it back in play, takes it out of the balances.
- **Add round** opens a compact pop-up, two small score boxes to a row, so a full table fits above the keyboard; the round-by-round table runs rounds across, newest first in view. Fix a round with its ✎ and confirm the change.
- Poker and Rummy groups each have a **leaderboard**: games, wins, money won or lost, best night. The **Poker** menu lists the nights you played.

A rummy game, hand by hand

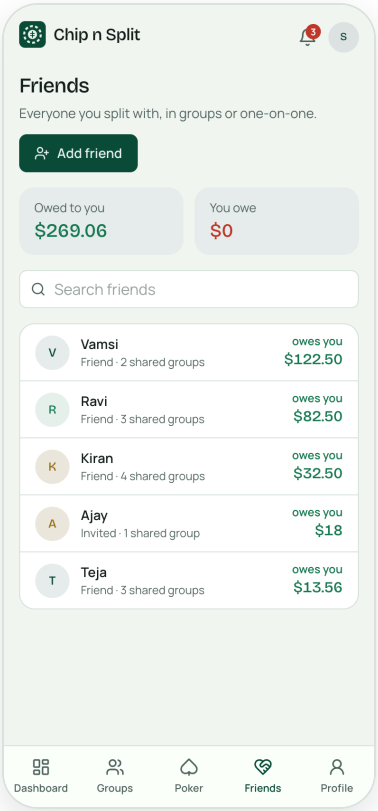

Poker leaderboard

FEATURE 6

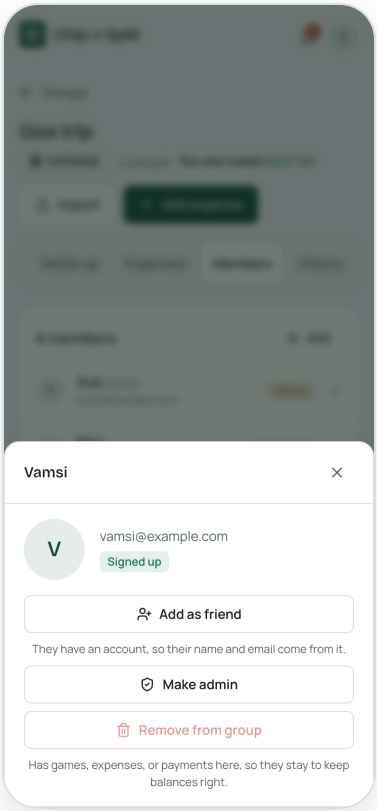

Friends

The people you actually split with: friends you add, and anyone you've shared an expense, game, or payment with.

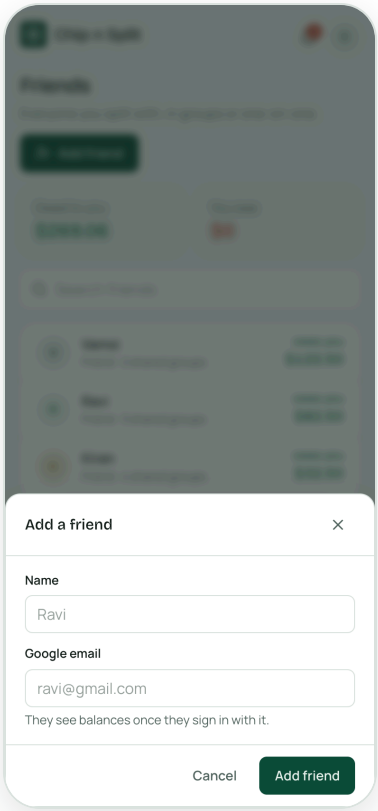

- Your list shows **signed-up friends you added**, plus **anyone you've had a transaction with**, guests included: an expense you're both in, a game you both played, or a payment between you. Being in the same group alone doesn't add someone.
- **Add as friend**: tap anyone's picture in a group or game; their card (name and email) has the button if they're signed up and not already a friend.
- **Add a friend** by name and Google email; they show up once they sign in with it.
- Each friend shows what you share: **2 shared groups**, **one-on-one**, or **nothing shared yet**.
- A friend's page adds up your one-on-one expenses into one **Balance** per currency, plus your balance in each shared group, each with **Settle**.
- **Remove friend** once you're settled up. They come back on their own if a balance with them opens again. Removing a friend never takes them out of a group.

Friends you added or dealt with

Tap someone: Add as friend

Add a friend by Google email

FEATURE 7

Who can do what

Simple roles, checked by the database itself, so they hold even if someone tries to get around the app.

Every member

Add, edit, delete, and restore expenses. Start games. Record payments. Add people.

A game's host

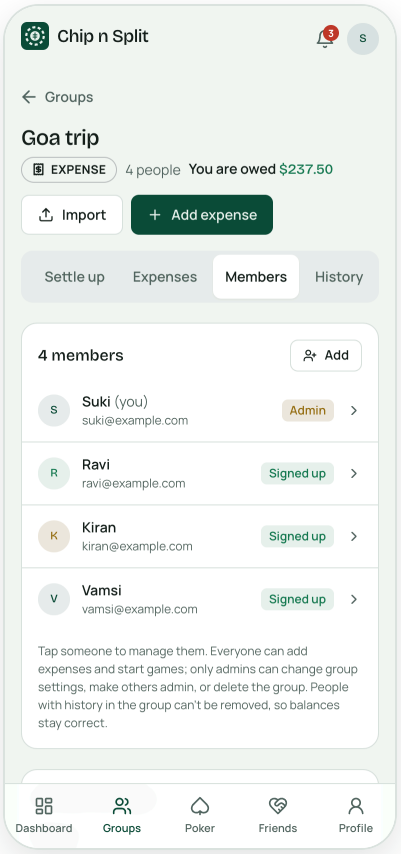

Whoever started the game runs it: buy-ins, cash-outs, finalize, mark paid, delete or restore it.

Group admins

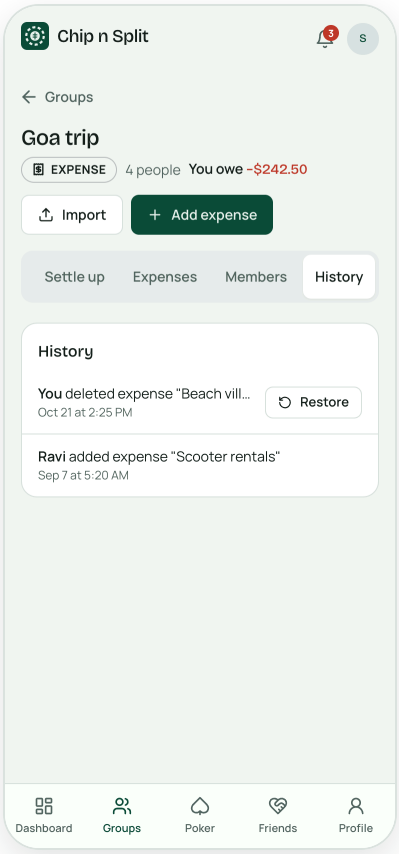

The group's creator, plus anyone they make admin. Change settings, make others admin, delete the group.

Delete safely

A group or a finished game can't be deleted until it's settled up. Deleted expenses and games can be restored.

Members: how many, and the creator is Admin

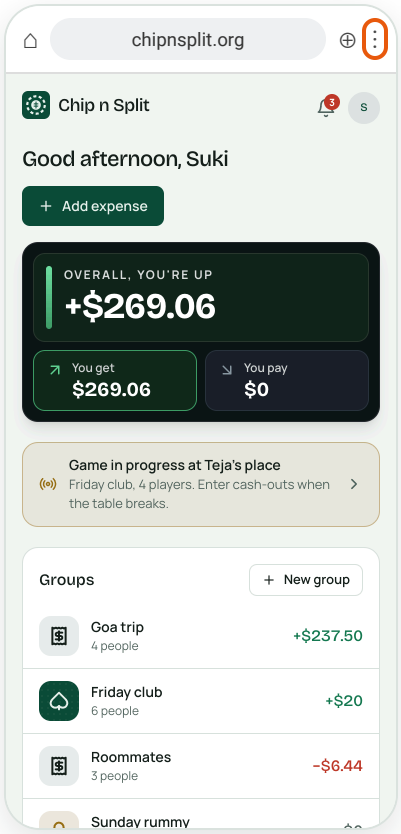

History: Restore a deleted item

INSTALL · ANDROID

Install on Android (Chrome)

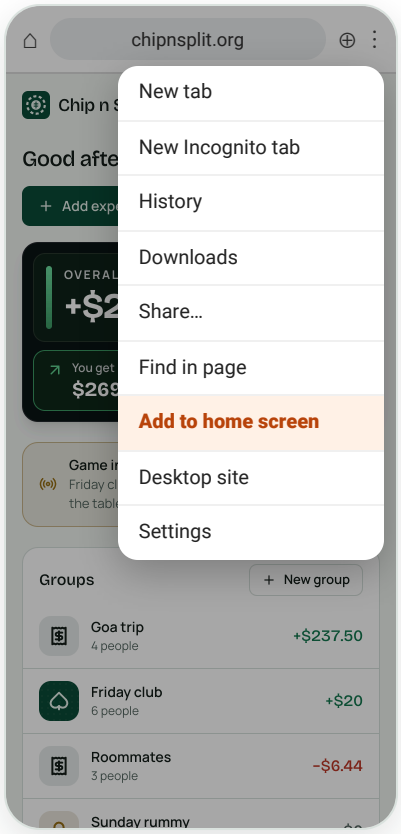

Chip n Split installs like an app: its own icon, full screen, no app store. Open **chipnsplit.org** in Chrome, then:

1

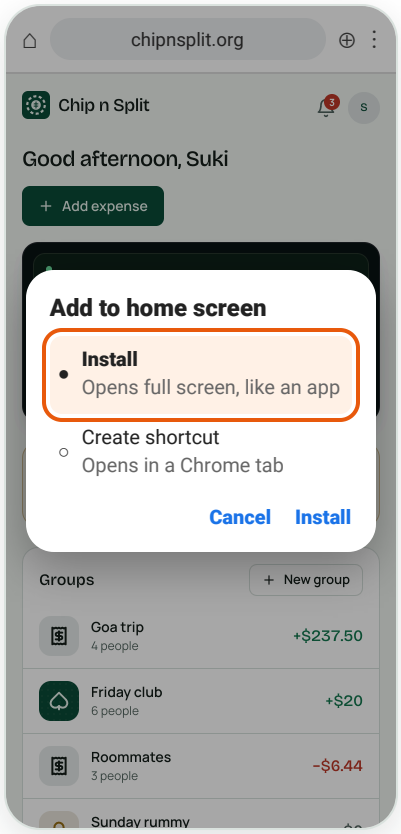

Tap the ⋮ menu at the top right of Chrome.

2

Choose **Add to home screen** (some versions say **Install app**).

3

Pick **Install** (not Create shortcut), then **Install** again.

The **Chip n Split** icon lands on your home screen and in the app drawer. It opens full screen, signs you in once, and updates itself. To remove it: long-press the icon → **Uninstall**. Chose **Create shortcut** by mistake? Delete that icon and install again.

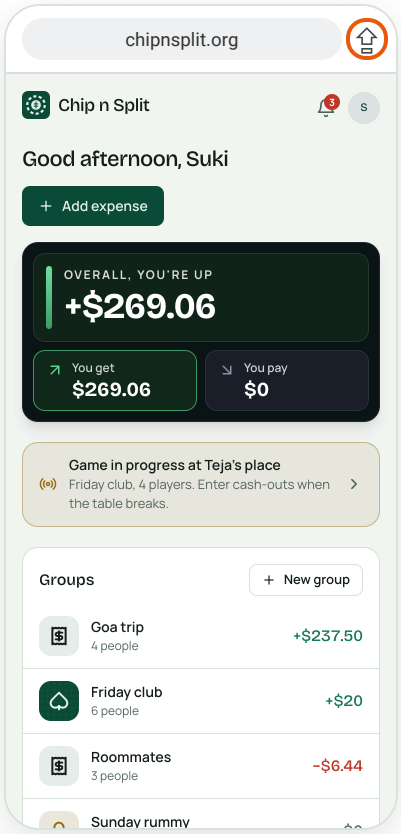

Illustrations of Chrome's own menus. Exact wording varies a little between Chrome versions.

INSTALL · IPHONE

Install on iPhone (Chrome)

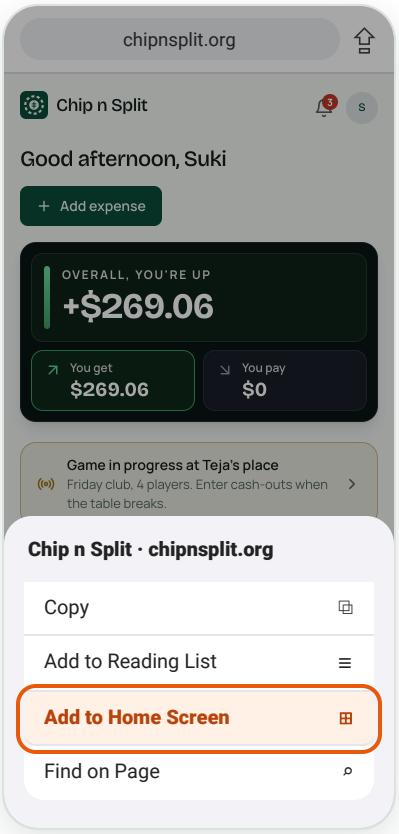

On iPhone, Chrome adds it to the Home Screen from the Share button (iOS 16.4 or later). Open **chipnsplit.org** in Chrome, then:

1

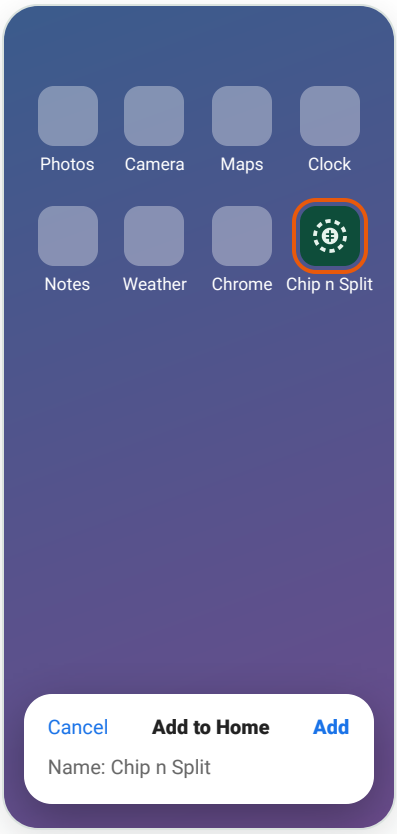

Tap the **Share** icon (square with an arrow) at the right of the address bar.

2

Scroll the list and tap **Add to Home Screen**.

3

Keep the name and tap **Add**. The icon appears on your Home Screen.

Using **Safari** instead? Same steps: the **Share** button at the bottom → **Add to Home Screen** → **Add**. Opened from the icon, it runs full screen like an app. To remove it: long-press the icon → **Remove App** → **Delete from Home Screen**.

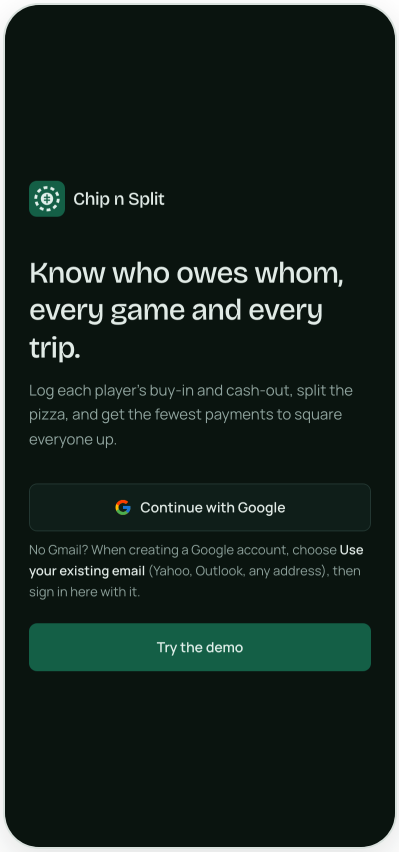

Illustrations of Chrome's and iOS's own screens. Exact wording varies a little between versions.

SECURITY

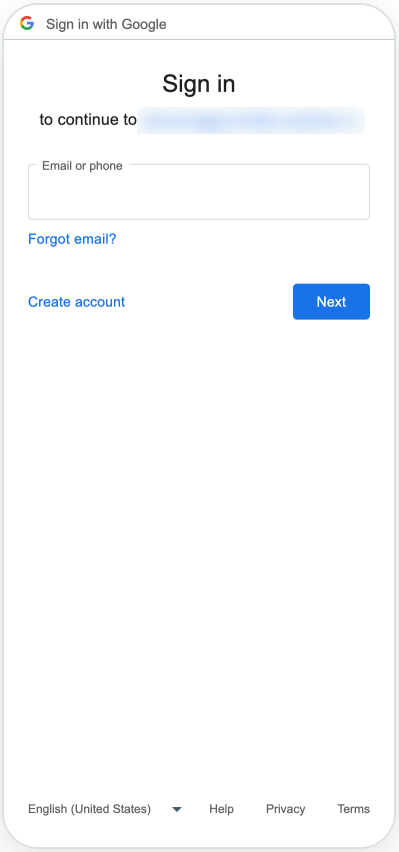

Signing in with Google

Chip n Split never sees or stores a password. Google does the sign-in, on Google's own page.

Tap "Continue with Google" → **Google's sign-in page** → **Google confirms it's you** → **You're in**

The app's sign-in screen

Google's own page (accounts.google.com)

No passwords, ever

Your password and 2-step verification stay with Google. The app only gets Google's confirmation.

Only name, email, photo

No access to Gmail, Drive, contacts, or anything else in your Google account.

Private to your groups

The database itself checks every request: you only see groups you belong to.

Encrypted, and revocable

HTTPS everywhere. Remove the app anytime: Google Account → Security → Third-party apps.

> No money moves through the app and no bank details are stored; it only records who owes whom. No Gmail? Create a Google account with your existing email (Yahoo, Outlook, …) and sign in with that.
